**Analysis of
Animal Feed
Products
Sold in Connecticut
2001**

BY MARYJANE INCORVIA MATTINA

*Bulletin 979
March 2002*

From January 1, 2001 through December 31, 2001 the Department of Analytical Chemistry at The Connecticut Agricultural Experiment Station analyzed 256 animal feed products sold in Connecticut. The samples represented both products for domestic animals and for commercial agricultural operations. Forty-seven manufacturers were represented. The products were collected by John Schneider and Alton Van Dyke of the Connecticut Department of Agriculture and were analyzed by Craig Musante and Mamie Pyles under the supervision of Dr. David Stilwell.

A sample is reported to be unsatisfactory if the found value of a substance differs from the label guarantee using the percent analytical variation guidelines recommended by the Association of the American Feed Control Officials. Of the total number of samples, 22 (8.6%) were found to be unsatisfactory in one or more macronutrients. Specifically, 6 samples were deficient in protein; 10 were deficient in fat; and 6 contained an excess of fiber. In the accompanying Table 1 are shown the results of the analyses of macronutrients. A deficiency in a label-guaranteed substance value (%G) is indicated by a minus (-) sign next to the laboratory-found substance value (%F) and an excess of a substance by a plus (+) sign. Micronutrients are reported in Table 2 with deficiencies (-) and excesses (+) indicated next to the laboratory-found values. Data in Table 2 are in percent unless otherwise indicated. Of the 146 samples analyzed for micronutrients, 32 unacceptable levels of micronutrients were detected in 26 samples.

Table 1. Results of Analyses of Feed Products.
